**Do Opposites Detract? Intrahousehold Preference
Heterogeneity and Inefficient Strategic Savings***

Abstract

This paper uses a field experiment to test whether intrahousehold heterogeneity in discount factors leads to inefficient strategic savings behavior. I gave married couples in rural Kenya the opportunity to open both joint and individual bank accounts at randomly assigned interest rates. I also directly elicited discount factors for all individuals in the experiment. Couples who are well matched on discount factors are less likely to use costly individual accounts and respond robustly to relative rates of return between accounts, while their poorly matched peers do not. Consequently, poorly matched couples forgo significantly more interest earnings on their savings.

Keywords: intrahousehold allocation, saving, preference heterogeneity

*I thank Abhijit Banerjee, Esther Duflo, and Tarnet Suri for invaluable advice and feedback at all stages of this project. I am also grateful to Pascaline Dupas, Eric Edmonds, Dan Keniston, Enzo Lattin, Ben Olken, Josh Schwartzstein, Rob Townsend, Jonathan Zinman, and numerous seminar participants for many useful comments. This project would not have been possible without the tireless assistance, hard work, and commitment of many employees of Family Bank. I am particularly indebted to Victor Kariuki Mwangi, Steve Marero, and Michael Awarui Wani. I also thank Sonnet Makana for her superb field management, Moses Barasa for his expert advice, and the IPA enumerators for their excellent assistance with the data collection. I gratefully acknowledge the financial support of the Russell Sage Foundation, the George and Olivia Shulze Fund, MIT's Jaramel Poverty Action Lab, and the National Science Foundation's Graduate Research Fellowship. The study protocol in this paper was approved by IRBs at MIT, the Kenya Medical Research Institute, and IPA-Kenya. All errors are my own.
