Abstract

In settings where an individual's labor choices are constrained, the inability to work maggenerate prochaocial barn. This paper presents a causal estimate of the psychosocial value of employment in the Robingya refugee camps of Banghelosh. We engage 725 individuals in a field experiment with three arms: (1) a control arm, (2) a weekly only one, and (3) a gainful employment arm, in which work in offered and individuals are paid weekly the approximate equivalent of that in the cash arm. We find that employment candlers significant psychosocial benefits beyond the inpacts of cash alone, with effects concentrated among males. The cash arm does not improve psychosocial wellbeing, despite the provision of each at a weekly amount that is more than twice the amount held by recipients in sorings at baseline. Consistent with those findings, we find that 60% of those in our work treatment are willing to forego cash payments to instead work for five. Our results have implications for social protection policies for the suremplayed in low income countries and refugee populations globally.

The Psychosocial Value of Employment

In settings where an individual's labor choices are constrained, the inability to work may generate psychosocial harm. This paper presents a causal estimate of the psychosocial value of employment in the Rohingya refugee camps of Bangladesh. We engage 745 individuals in a field experiment with three arms: (1) a control arm, (2) a weekly cash arm, and (3) a gainful employment arm, in which work is o ered and individuals are paid weekly the approximate equivalent of that in the cash arm. We find that employment confers significant psychosocial benefits beyond the impacts of cash alone, with effects concentrated among males. The cash arm does not improve psychosocial wellbeing, despite the provision

of cash at a weekly amount that is more than twice the amount held by recipients in savings at baseline. Consistent with these findings, we find that 66% of those in our work treatment are willing to forego cash payments to instead work for free. Our results have implications for social protection policies for the unemployed in low income countries and refugee populations globally.
